C31 MINI DOME HIDE

I originally designed the Dome Hides for my own photography many years ago. I knew the size and height of the hides I wanted. I experimented with the position of the windows and came up with an optimum design. Over the years, we have supplied many Dome Hides to photographers, film and TV companies including the BBC. We have always made up specials to customer's requirements i.e. larger windows for broadcast cameras. We have now added some extras/options to our online shop to help you customize your Dome hide.

Our hides have been built to last. The best materials have been used and sewn together with an industrial over lock machine to give added strength. High quality nylon webbing peg loops and nylon guy ropes used. The pegs and poles are high tensile aluminum, these are very strong, but extremely light - an important factor in designing and building a hide. Our hides are sold worldwide, and we have materials for all seasons and climates including snow and desert patterns.

Used by the BBC for filming: Springwatch 2011, Halcyon River Diaries May 2010, BBC Lost Land of the Volcanoes Sept 2009, BBC Natural World 2009, BBC Springwatch 2008, BBC Wild China 2008, BBC Springwatch 2006, Britain Goes Wild - 2004, Wildlife In Your Garden 2003.

We never say we are the best, that's for our customers to decide but what we can say is that our products are designed through experience and are made in our workshop in Devon using the best materials. For our Dome hides we use proofed and breathable poly-cotton material (nylon material tends to run with condensation in the cold and be noisy in the wind). Our dome hides pack into a small bag which is easy to carry and stow. We don't use spring out steel frames.

A REVOLUTION IN HIDE DESIGN – LIGHTWEIGHT - QUICK TO PUT UP - FREE-STANDING

Made from proofed material in Advantage Timber, Camouflage pattern (as in picture) and All Purpose Snow and also available in Desert pattern (not proofed) and NEW Khaki Camouflage pattern (not proofed).

Approx 0.95m high at centre (inside) 1.05m wide and 1.6m long at base; weight including bag, guy ropes and pegs. 2.5kg.

The Mini Dome Hide is lower and narrower than our other dome hide. We have a range of hides for different styles of photographer situations.

The Mini Dome Hide has been designed for use by one person with room for tripod and bag. It has a built in ground sheet (can be made without) as the user will need to sit on the floor, C11 kneeling mat or our C26.1 padded folded seat. The windows, door and tripod slit are similar to the larger dome hides. The tripod slit can also be used for ground level photography.

The Mini Dome Hide is light enough to creep towards your subject by holding the hide just off the ground in front of you.

Our hides have been built to last. The best materials have been used and sewn together with an industrial over-lock machine to give added strength. High Quality nylon webbing peg loops and nylon guy ropes used. The pegs are high tensile aluminum, these are very strong, but extremely light - an important factor in designing and building a hide. Our hides are sold worldwide to photographers, naturalist and film-makers, and we have materials for all seasons and climates including snow and desert patterns.

Our dome hides are lightweight, compact, quick to put up and free-standing.

The Mini Dome Hide has all the features you want in a hide. I've put together the things I've been asked for over the years of running Wildlife Watching Supplies and my own wildlife photography.

Quick to put up - just thread the two aluminum flexi-poles through, and then hook the ends into the brass eyelets at the corners.

The hide is free-standing, but in strong winds the guy ropes and pegs provided can be used. Guy rope loops are also on the inside of the hide. These can be used if you want to move the hide while you are in it. The dome hide also has pockets around the base for putting kit in or stones instead of pegging down.

Windows - One main front window and two side windows. The front window 30cm (12") x 26cm (10") has a material flap, scrim net and insect net. The base of the front window is 68cm from the ground. The side windows 15cm (6") square have a material flap and net. All the windows are

large enough to put a long lens through. There is also a tripod flap at the front below the front window which can also be used for low level photography.

Central back flap with overlap, Velcro tabs and tie cords (lens can be put through the flap between the Velcro tabs).

Folds down to fit in a bag 48cm (19") by 18cm (7") dia. and only weighs approx. 2.6kg including the two aluminum alloy flexi-poles and pegs and is light enough and small enough to fit in your rucksack or suitcase.
